## Research Papers

---

### Job Market Paper

- ***Digital Innovation Amplifies Sustainability: Intangible Asset Synergies and Firm Performance***

The study examines how digital innovation and sustainability affect the performance of U.S.-listed firms. It finds that sustainability investments boost profitability and valuation more when paired with digital innovation, supported by causal evidence from regulatory variation. It also examines how governance and resource strategies reduce agency costs during digital transformations.

### Working Papers

- ***The Price of Green: Policy-Induced Climate Salience and Corporate Trade-Offs***

This study explores how investor pressure and board oversight shape research and development strategies. It also examines how awareness of climate policy affects firms' environmental performance, innovation strategies, and valuation, emphasising the trade-offs between targeted green innovation and broader research and development efforts.

- ***The Cost of Climate Exposure: Disentangling Climate Risk Horizons (Work in Progress)***

Examines how climate-risk pricing across various time horizons reveals how disclosure and executive compensation structures influence firms' ability to manage transition versus physical risks using conference-call transcripts and macro-level climate exposure measures.

## Presentations

---

- International Conference in Banking and Financial Studies (ICBFS)
- Academy of Sustainable Finance, Accounting, Accountability & Governance (ASFAAG) Conference
